

# Steve's Written Analysis

Steve just graduated with his finance degree, his parents are going his first clients and would like to invest in Green Energy. Unfortunately, Steve's parents haven't done much research, so they decided to invest in DAQO New Energy Corp. Steve hired me to diverse their funds, he created an Excel File containing the Stock Data he wants me to analyze. For this job I will be using an Excel Extension called VBA (Visual Basic for Application). VBA is programming language that interacts with Excel, it can Read and Write in Excel Work Sheet, make calculations, and use complex logic to perform analysis. This allows Steve to reuse with any Stock and reduces the chance of errors.

tickerVolume, tickerStartingPrices, tickerIndex, and tickerEndingPrices were the codes used to organize the chart.

Dim startTime As Single, Dim endYear As Single, yearValue = InputBox, were the codes used for the button.

Advantage of Refactoring would be that it simplifies support and code updates. Also reduces complexity to understand everything thoroughly.

Disadvantages would be that it is really time consuming, you really never know how long the process would take.
